▸ PROFILE

DevOps engineer since 2023, building CI/CD, cloud infrastructure and automation for European enterprises on AWS/EKS, IBM Cloud, Azure and GCP, after 10 years leading finance teams. Most recently I integrated LLMs into CI/CD pipelines at P&G, and I now run an observable LLM inference platform of my own. Finance is my edge: I treat cloud and inference cost as an engineering problem, with budgets, unit economics and P&L ownership as native skills, not an add-on.

▸ EXPERIENCE

AI Infrastructure & Platform Engineer

Jul 2026 – Present

Amen Bouteraa DevOps Solutions · Self-employed · Warsaw 🇵🇱

▸ Observable LLM platform

- Built an observable LLM inference service on FastAPI with Prometheus metrics for latency, tokens/sec, in-flight saturation, errors and cost per request, visualised in provisioned Grafana dashboards.
- Added retrieval-augmented generation on Qdrant (paragraph chunking, embeddings, top-k with source scores), instrumented for retrieval latency and low-confidence answers.
- Provisioned the host on Oracle Cloud with Terraform (compartment, network, IAM, ARM compute) and containerised the stack with Docker Compose, plus a load generator that keeps rate()-based dashboards meaningful.
- Published runnable public replicas of the P&G AI-augmented CI/CD workflows (Contract Refiner, Post-Deploy QA, Secure API) as GitHub Actions demos.

Stack: Python, FastAPI, Ollama, Qdrant, Prometheus, Grafana, Docker Compose, Terraform, OCI

▶ llm-platform ↗

▸ Earno, a savings app: infrastructure, delivery pipeline and store operations

- Shipped and now operate a production mobile product on both stores, owning the whole chain alone: Postgres schema and RLS, 23 Deno edge functions, CI/CD, release automation, observability and billing, across prod and staging environments with 192 migration-based deploys.
- Built the delivery pipeline in GitHub Actions: lint, typecheck and a 1,244-test suite, plus a Metro bundle stage that catches unresolvable modules the other three are blind to, and schema-plus-functions deployed on push with nightly prod→Cloudflare R2 backups.
- Automated over-the-air releases (EAS Update) with a self-verifying publish step that greps the built bundle to prove which backend and API keys it embeds before anything ships, written after a silent misconfiguration pushed a staging backend and blank payment keys to live users.
- Instrumented crash reporting end to end (Sentry, EU region) with source maps uploaded per OTA release, so a minified frame in a published bundle resolves to real source, and classified network noise structurally so it stops burying real signal.
- Integrated subscription billing (RevenueCat into Apple and Google IAP) through an idempotent webhook: tolerant of out-of-order delivery, with the invariants expressed as atomic guards in the UPDATE's own WHERE clause, and entitlement reconciled across store, server and device.
- Automated App Store Connect via its REST API (version records, metadata, categories, review submissions, subscription offers), replacing a manual console workflow and cutting release prep to a single scripted pass.
- Built a creator-attribution revenue ledger: per-partner payouts matured against Apple's 14-day refund window, permanent disqualification on refund, and monthly statements surfaced in an internal React/TypeScript admin dashboard over RLS-gated views.

Stack: Supabase/Postgres, Deno edge functions, GitHub Actions, EAS Build/Update, React Native, TypeScript, Sentry, RevenueCat, Cloudflare R2, App Store Connect API

▸ TECHNICAL SKILLS

ORCHESTRATION

Kubernetes · Docker · Helm

CI/CD & GITOPS

ArgoCD · Jenkins · GitHub Actions · GitLab CI

IAC & CONFIG

Terraform · Terragrunt · Ansible · Puppet

CLOUD

AWS · Azure · GCP · IBM Cloud · DigitalOcean · OCI

OBSERVABILITY

Prometheus · Grafana · OpenTelemetry

AI / MLOPS

Azure OpenAI · Ollama · RAG · FastAPI · Qdrant · pgvector · Redis

FINOPS

Budgeting & forecasting · P&L / cost centres · LLM cost telemetry

DEV & SCRIPTING

Python · Bash · React · TypeScript · Tailwind

▸ EXPERIENCE (CONT.)

DevOps + MLOps Engineer

Feb 2026 – Jun 2026

Procter & Gamble · B2B via LTM · Warsaw 🇵🇱

Proof-of-concept AI-augmented CI/CD test-automation platform, blending DevOps with MLOps around LLM integration in production pipelines.

- Delivered two architectures: a centralized reusable GitHub Actions workflow shared across teams, and an embedded PR-triggered pipeline gated on pre-merge events.
- Built an iterative LLM agent loop that generates API tests from OpenAPI specs, runs them, and refines until pass-rate targets are met, gating commits and PR comments.
- Engineered secrets across three identity providers (CyberArk/Centrify with Fernet indirection, Azure AD, GCP Secret Manager) behind a five-pattern auth strategy.
- Added LLM observability for team adoption: per-call token telemetry, SHA-256 drift hashing and per-iteration audit sidecars.
- Generated and ran pytest and Newman/Postman collections against a live service spun up with Docker Compose, parsing JUnit results to drive the agent's refine loop.
- Wired cross-repo PR context via the GitHub API with org-scoped tokens, JIRA REST enrichment and JUnit rollups into the prompt, posting results back as a sticky PR comment.
- Made the pipeline language-agnostic, generating and validating API tests across FastAPI, Spring, NestJS and Go services behind an Azure Application Gateway allowlist.
- Enforced LLM output guardrails (allow-listed patch operations, JSON round-trip validation, rejected-edit feedback) so generated edits stayed safe to auto-apply.

Stack: GitHub Actions, Azure OpenAI, Python 3.11, Newman/Postman, Centrify, Azure AD, GCP Secret Manager, Fernet, Azure Application Gateway

▶ Contract Refiner · ▶ Post-Deploy QA · ▶ Secure API

DevOps Engineer

Jan 2025 – Jan 2026

COCUS AG · B2B via Data Craft 🇫🇷

Cloud migration for a major client: a highly available AWS/EKS platform with a strong focus on automation and GitOps.

- Provisioned a highly available AWS landing zone with Terraform and Terragrunt (VPC isolation, EC2/ASG, ALB, S3, EBS).
- Built a serverless dynamic Ansible inventory (EventBridge + Fargate) driving the Kubernetes API to manage namespaces, configmaps and RBAC.
- Deployed and operated highly available EKS clusters (Services, RBAC, HPA) and implemented GitOps with CodePipeline/CodeBuild and ArgoCD, gated by kube-score and OPA.
- Wrote Ansible playbooks configuring nodes end to end: system updates, Nginx with SSL and virtual hosts, firewall rules and connectivity tests.
- Diagnosed and resolved daily Kubernetes incidents: CrashLoopBackOff from config drift, failed readiness probes and NetworkPolicy bugs blocking service-to-service traffic.
- Standardized configuration with Kustomize and migrated secrets to Vault, adding automated manifest validation that cut deployment failures.
- Centralized observability (CloudWatch to Prometheus/Grafana) with SNS/EventBridge alerting; delivered zero-downtime PostgreSQL migrations on RDS.

Stack: EKS, Terraform, Terragrunt, Ansible, ArgoCD, EBS, S3, SNS, ALB, EventBridge, Fargate, CloudWatch, Prometheus, Grafana, Vault, OPA, RDS

DevOps Engineer · Freelance

Feb 2025 – Jul 2025

Fiverr · developer-platform client

▸ Cloud Symphony, infra automation dashboard

- Automated EC2 provisioning with Terraform and node configuration with Ansible (Docker, Flask, Nginx, Systemd) across AWS, GCP and Azure workflows, with a React/TypeScript dashboard for provisioning and CI/CD status.

Live ↗ · Code ↗

▸ ArgoCD GitOps pipeline demo

- Built a Git-driven CI/CD pipeline with ArgoCD and Helm, with drift detection, auto-sync reconciliation, a commit-to-deployment dashboard and GitHub Actions CI for infra and app.

Live ↗ · Code ↗

Stack: Terraform, Ansible, Docker, Kubernetes, ArgoCD, Helm, GitHub Actions, AWS, GCP, Azure, React, TypeScript

- Available immediately

▸ EXPERIENCE (CONT.)

DevOps Engineer · N2 Support

Mar 2024 – Dec 2024

Sodexo · Freelance B2B via Data Craft 🇫🇷

N2 support team owning platform stability and automation on an IBM Cloud and Kubernetes environment.

- Handled complex technical incidents end to end, with in-depth diagnostics via logs, monitoring tools and performance analysis to find true root cause.
- Supported the platform migration from Red Hat OpenShift to Kubernetes, reducing operational complexity and harmonizing the toolchain.
- Automated provisioning of customer-requested assets (VSI, databases, VIPs, NAS) with a Python bulk-provisioning script that prepared JSON API requests and tracked status, drastically reducing manual work.
- Built self-remediation automation: a DiskPressure-triggered cleanup script (prune images, purge failed pods, Slack notify) and a TLS auto-renewal script that rotated Kubernetes secrets.
- Diagnosed OOMKilled pods from mis-sized batch memory limits and a PostgreSQL connection-pool exhaustion, adding monitoring and DB-level limits to prevent recurrence.
- Ran routine maintenance (service restarts, disk-pressure cleanups, log purging) and authored Confluence runbooks that standardized recurring interventions and cut resolution time.

Stack: Kubernetes, OpenShift, Ansible, Python, Terraform, IBM Cloud, Prometheus, Confluence

CI/CD Automation Project

Nov 2023 – Jan 2024

Alcon · Cloud Native CI/CD K8s Stack · alongside my finance role 🇵🇱

- Set up a full Kubernetes cluster (auto-scaling, health, secrets, configMaps, RBAC, network policies) with Terraform-automated provisioning.
- Co-built a no-code DevOps dashboard visualizing deployments, HPA scaling, Jenkins pipelines and security events in real time, so non-technical users could operate deployments without the command line.
- Implemented advanced security, observability and backup (Prometheus, Grafana, Kubernetes Secrets, automated DB snapshots). Earned a Lean Six Sigma Yellow Belt for improving DevOps workflows.

Live ↗ Code ↗

Stack: Kubernetes, Jenkins, Docker, Helm, Terraform, Ansible, Prometheus, Grafana, NGINX, React

▸ PREVIOUS CAREER · FINANCE

Cluster Head of Finance

Apr 2023 – Dec 2024

Alcon

Led FP&A across 3 international business units and a team of 18, owning budgets, cost centres and P&L, and drove reporting automation with Power Query and Lean/Six Sigma. Strengthened leadership, process automation and cross-functional delivery.

Finance Operations Manager

Dec 2015 – Mar 2023

IBM

Grew from Credit Controller to Finance Operations Manager: led record-to-report teams for Canada and France, built a company-wide analytics dashboard, and ran a zero-downtime offshoring transition. Sharpened leadership, continuous improvement and an automation mindset.
